

# Deep Learning for NLP

---

Jay Urbain, PhD  
Professor, Electrical Engineering and Computer  
Science Department  
Milwaukee School of Engineering  
[urbain@msoe.edu](mailto:urbain@msoe.edu)

# TOPICS: Classification

- What is Natural Language Processing
- Why is NLP hard?
- NLP Vocabulary
- Text Classification
  - Word embeddings
  - Network architectures: MLP, CNN, RNN
  - TensorFlow, Keras, Pandas

# **WHAT IS NATURAL LANGUAGE PROCESSING (NLP)?**

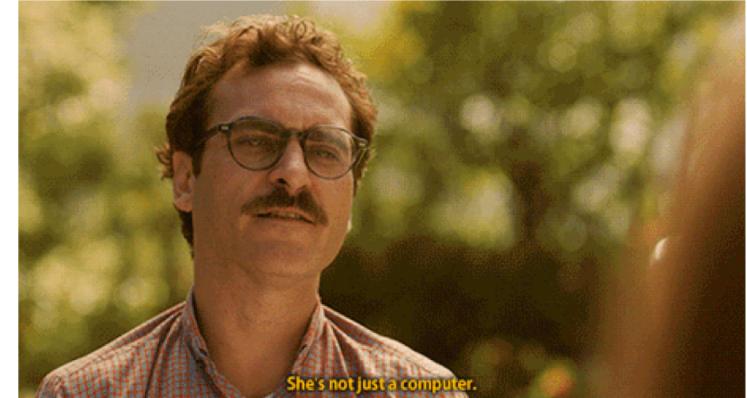

# WHAT IS A NATURAL LANGUAGE PROCESSING (NLP)?

“Natural language processing (NLP) is an area of computer science and artificial intelligence concerned with the interactions between computers and human (natural) languages, in particular how to program computers to process and analyze large amounts of natural language data. “

Wikipedia

**GOAL:** for computers to process or “*understand*” natural language in order to perform tasks that are useful such as question answering

- Add structure to unstructured text
- Full understanding for now is unsolved

She's not just a computer.

# NLP APPLICATIONS

- Keyword search
- Text classification
- Named entity recognition
- Machine translation
- Question answering, chatbot dialog systems
- Much more...

## Patient Deidentification

2019-04-04 15:13:09.055

<https://cis.ctsi.mcw.edu/deid/>

Date offset:

10

Patient name:

Input text:

Jay Urbain, jay.urbain@gmail.com, born December 6, 2156 is an elderly caucasian male suffering from illusions of grandeur and LBP. He is married to Kimberly Urbain, who is much better looking. Patient father, Francis Urbain has a history of CAD and DM. Jay has been prescribed meloxicam, and venti americano. He lives at 9050 N. Tennyson Dr., Disturbia, WI with his wife and golden retriever Mel. You can reach him at 414-745-5102.

# Search driven discovery: aggregating statistics from named entities

# Prologue – Medical Record Machine “Translation”

## - work with Bradley Crotty, MD

COLONOSCOPY Procedure Note. Date of Procedure: [1\_21\_2016]. Primary Physician: [PERSON] [PERSON] [PERSON], MD. Attending Physician: [PERSON] [PERSON], MD. Fellow:None. Indications: Colon cancer screening for family history of colon cancer Colon cancer screening for family history of polyps.. Previous COLONOSCOPY: Yes. Date: [8\_16\_2007]. Medications Administered: Agents given by the anesthesia service during MAC. Procedure Details: The patient was placed in the left lateral position and monitored continuously with ECG tracing, pulse oximetry monitoring and direct observations. Medications were administered incrementally over the course of the procedure to achieve an adequate level of moderate sedation. After anorectal examination was performed, the Olympus CF H180 was inserted into the rectum and advanced under direct vision to the terminal ileum. The procedure was considered not difficult. During withdrawal examination, the final quality of the prep was good.. Bowel Prep Scale Right Colon: Grade 2 (minor amount of residual staining, small fragments of stool, and/or opaque liquid, but mucosa of colon segment is seen well) . Bowel Prep Scale for Transverse Colon: Grade 3 (entire mucosa of colon segment seen well, with no residual staining, small fragments of stool, or opaque liquid) . Bowel Prep Scale for Left Colon: Grade 2 (minor amount of residual staining, small fragments of stool, and/or opaque liquid, but mucosa of colon segment is seen well) Additional rinsing and suctioning (600 ml) were necessary to obtain adequate views. A careful inspection was made as the colonoscope was withdrawn, which did include a retroflexed evaluation of the rectum. Findings and interventions are described below. Appropriate photo documentation was obtained. Overall [PATIENT] L [PATIENT] did tolerate the procedure well, without undue discomfort, hypotension or desaturation. At the completion of the procedure she was transferred from the endoscopy suite to be recovered in the FSC observation area per protocol and was discharged when criteria was met. After adequate recovery from sedation, she was discharged to home, with appropriate plans for follow up in place. Scope in time: 0741 Cecum reached time: 0747. Scope out time: 0759. Findings: Findings for the Anorectal: No mass. Findings for the Terminal Ileum:

### Translation

#### Date of procedure:

- 1\_21\_2016

#### Indications for colon cancer screening:

- Family history of polyps

#### Complications:

- The procedure was considered not difficult

#### Findings for the transverse colon:

- 1 polyp 2mm
- Tubular adenoma
- Hyperplastic polyp

#### NSAIDS should be avoided:

- 14 days

#### Recommendations:

- High fiber diet

# Question Answering

## Machine Reading for Question Answering

Experiments with deep encoder-decoder networks with memory and attention for question answering of medical records text. Select a question for the sample record, or supply a question. You may also provide your own passage of text from any source. Another passage sample from the WSJ is provided below. Modeled after the [SQuAD](#) data set. Training requires 50,000 to 400,000 training epochs using an AWS nVidia K80 or Tesla GPU instance. *Please note: this is a work in progress!*

### Passage

COLONOSCOPY Procedure Note Date of Procedure: [1\_21\_2016] Primary Physician: [PERSON] [PERSON] [PERSON], MD Attending Physician: [PERSON] [PERSON], MD Fellow:None Indications: Colon cancer screening for family history of colon cancer Colon cancer screening for family history of polyps Previous COLONOSCOPY: Yes. Bowel Prep Scale Right Colon: Grade 2 (minor amount of residual staining, small fragments of stool, and/or opaque liquid, but mucosa of colon segment is

### Sample questions

How long should NSAIDs be avoided?  
What is the Histopathologic Diagnosis?  
Was the procedure difficult?  
What were the indications for colon cancer screening?  
How was the patient monitored?  
What was retroflexed evaluation used for?  
What are the indications of colon cancer?  
What are the dietary recommendations?  
How many polyps were found?  
What was the transverse colon bowel prep scale?

### Question

How long should NSAIDs be avoided?

### Answer

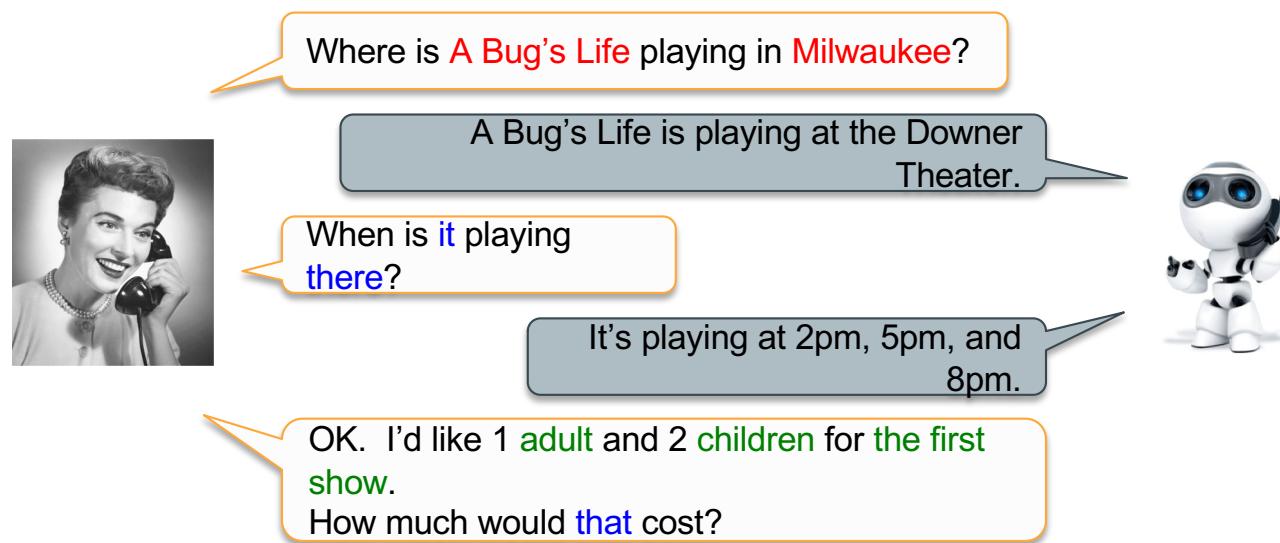

14 days

**WHY IS NLP HARD?**  
... and why Deep Learning may help

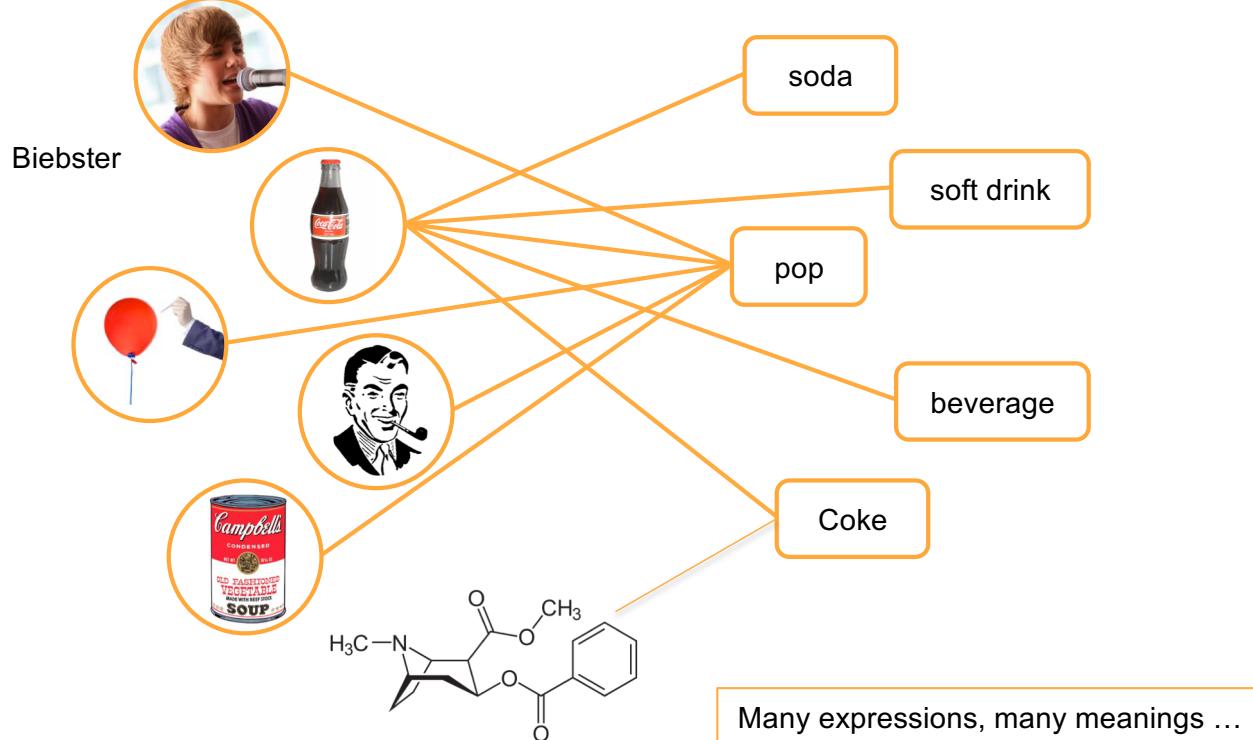

# Language: the ultimate UI

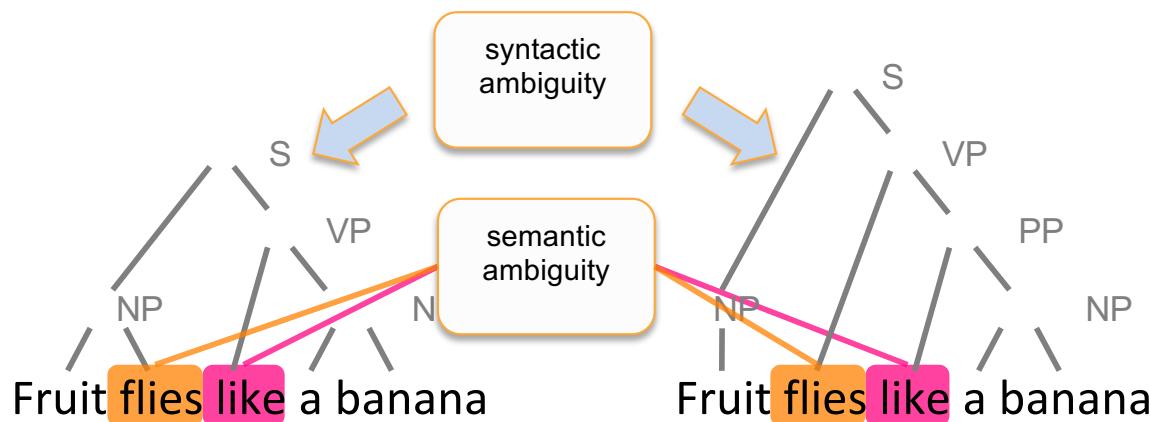

But we need domain knowledge, discourse knowledge, world knowledge

# Meanings and expressions

Big obstacle: relation between meanings and expressions is not one-to-one

# Syntactic & semantic ambiguity

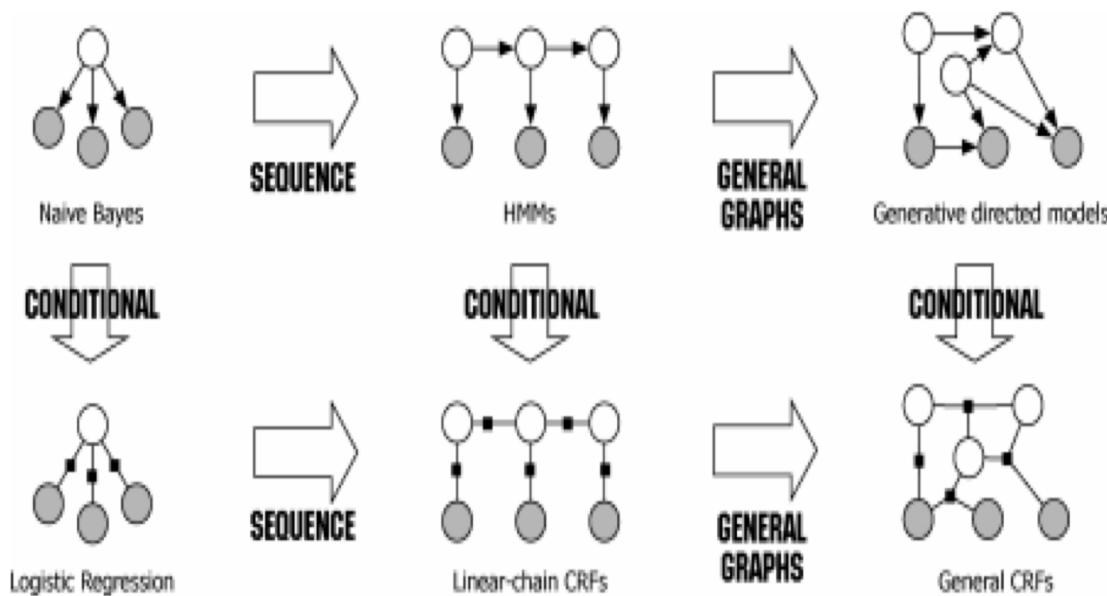

[“like” is a remarkable word: it can be used as a noun, verb, adverb, adjective, preposition, particle, conjunction, or interjection.]

photos from [worth1000.com](http://worth1000.com)

## Traditional NLP use “shallow” statistical machine learning models: HMM, MEMM, CRF

- <http://homepages.inf.ed.ac.uk/csutton/publications/crftut-fnt.pdf>

## Traditional Models: HMM, MEMM, CRF

- <http://homepages.inf.ed.ac.uk/csutton/publications/crftrt-fnt.pdf>
- Linear chain CRF for sequence class, Named entity CRF features

**Definition 2.2.** Let  $Y, X$  be random vectors,  $\theta = \{\theta_k\} \in \mathbb{R}^K$  be a parameter vector, and  $\mathcal{F} = \{f_k(y, y', \mathbf{x}_t)\}_{k=1}^K$  be a set of real-valued feature functions. Then a *linear-chain conditional random field* is a distribution  $p(\mathbf{y}|\mathbf{x})$  that takes the form:

$$p(\mathbf{y}|\mathbf{x}) = \frac{1}{Z(\mathbf{x})} \prod_{t=1}^T \exp \left\{ \sum_{k=1}^K \theta_k f_k(y_t, y_{t-1}, \mathbf{x}_t) \right\}, \quad (2.18)$$

where  $Z(\mathbf{x})$  is an input-dependent normalization function

$$Z(\mathbf{x}) = \sum_{\mathbf{y}} \prod_{t=1}^T \exp \left\{ \sum_{k=1}^K \theta_k f_k(y_t, y_{t-1}, \mathbf{x}_t) \right\}. \quad (2.19)$$

$W=v$	$w_t = v$	$\forall v \in \mathcal{V}$
$T=j$	part-of-speech tag for $w_t$ is $j$ (as determined by an automatic tagger)	$\forall \text{POS tags } j$
$P=I-j$	$w_t$ is part of a phrase with syntactic type $j$ (as determined by an automatic chunker)	
Capitalized	$w_t$ matches [A-Z] [a-z] +	
Allcaps	$w_t$ matches [A-Z] [A-Z] +	
EndsInDot	$w_t$ matches [^\.] + \. *	
	$w_t$ contains a dash	
Acro	$w_t$ matches [A-Z] [a-z] + [A-Z] + [a-z]	
Stopword	$w_t$ matches [A-Z] [A-Z \. ] * \. [A-Z \. ] *	
CountryCapital	$w_t$ appears in a hand-built list of stop words	
:	$w_t$ appears in list of capitals of countries	
	many other lexicons and regular expressions	
$q_k(\mathbf{x}, t + \delta)$ for all $k$ and $\delta \in [-1, 1]$		

Custom solutions for each domain, and for each application.  
 Difficulty capturing long-range dependencies, context, and semantics

# NLP: With deep Learning, reality is getting closer to vision

# NLP VOCABULARY

# VOCABULARY

- *token* - A unit of text, typically a word. Could also be:
  - Group of words like "New York"
  - Sub-word like "mega" in "megabyte"
  - Letter like "m"
- *tokenizing* - Creating tokens, representing tokens as a distinct number
- *document* - Sequence of *tokens*
  - Could be whole book or a tweet
  - Classify each *document* as having a positive or a negative sentiment
- *corpus* - A set of *documents*
  - We'll use a *corpus* containing movie reviews since each *document* is paired with a rating indicating *sentiment*

# VOCABULARY

- *n-grams* - adjoining sequence of  $n$  tokens (words)
  - Sometimes referred to as shingles
- *sentiment analysis* - evaluate mood of n-grams
  - Determine the attitude / emotion of text
- *tf-idf* = term frequency \* inverse document frequency
  - Numerical statistic intended to reflect significance of a word to a document in a corpus
  - Popular term-weighting schemes
  - TF increases each time a word appears in a document
  - IDF decreases each time a word appears in a corpus

# TEXT CLASSIFICATION

# TEXT CLASSIFICATION

- We will be training several neural network models for text classification.
- In text classification, documents (or segments of text) are assigned to different *categories*.
- For example, categories could be positive or negative sentiment, different authors, different topics, or different writing styles.
- Interesting problems like ambiguity arise:
  - "To sanction" can mean "to permit" or "to punish."
  - Berkshire Hathaway vs. Anne Hathaway
- Capturing context at different hierarchical levels is key. Deep Learning can help us!

# WINDOW TEXT CLASSIFICATION

Classify **Paris** in the context of this sentence with window of length 2:

$$\begin{array}{ccccccc} \dots & \text{museums} & \text{in} & \text{Paris} & \text{are} & \text{amazing} & \dots \\ & \bullet\bullet\bullet & \bullet\bullet\bullet & \bullet\bullet\bullet & \bullet\bullet\bullet & \bullet\bullet\bullet & \end{array}$$
$$X_{\text{window}} = [x_{\text{museums}} \quad x_{\text{in}} \quad x_{\text{Paris}} \quad x_{\text{are}} \quad x_{\text{amazing}}]^T$$

# EMBEDDINGS

# WORKING WITH TEXT

- Neural networks don't take raw text as input. Only numeric tensors.
- **Vectorizing text** is the process of transforming text into numeric tensors. This can be done in multiple ways:
  - Segment text into words, and transform each word into a vector.
  - Segment text into characters, and transform each character into a vector.
  - Extract n-grams of words or characters, and transform each n-gram into a vector.
- Apply categorical transformation:
  - One-hot encoding
  - Word embedding

# ONE-HOT ENCODING

- Words are categorical, they have no *ordinal* relationship. So they can't just be numerically encoded.
- For each word:
  - Numerically encode each word: {red:0, green:1, blue:2}
  - Generate vector of zeros the length of all possible words/categories
  - Set the index value for the word in the vector

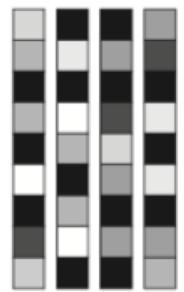

red,	green,	blue
1,	0,	0
0,	1,	0
0,	0,	1

# WORD EMBEDDINGS

- One-hot results in *sparse vector representation* (mostly zeros, hi dimensions).
- Word embeddings provide *dense vector representations*.
- Idea is to “embed” words into a lower-dimensionality space.
- The dimensions of this space are typically defined by word context, i.e., semantically similar words are embedded near each other.
- Popular algorithms:
  - PMI, Word2Vec: Skip-gram or CBOW, GLoVE, FastText

One-hot word vectors:  
- Sparse  
- High-dimensional  
- Hardcoded

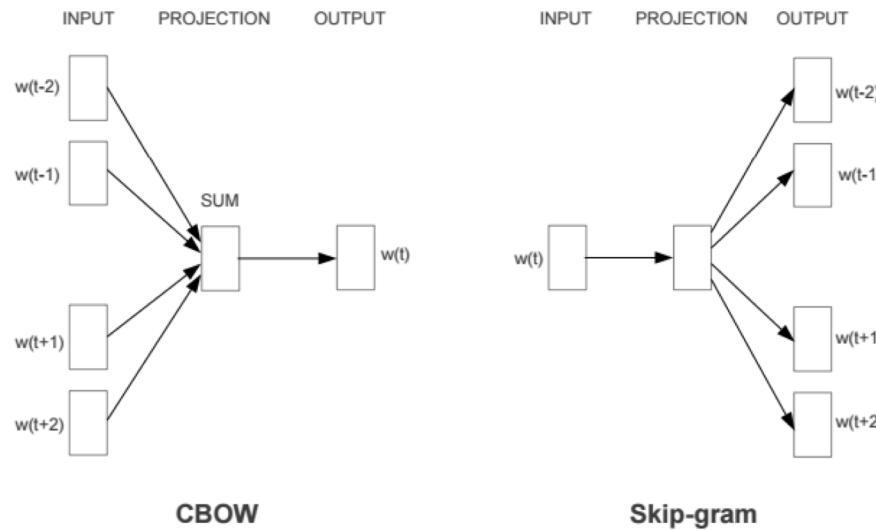

Word **embeddings**:  
- Dense  
- Lower-dimensional  
- Learned from data

# The Distributional Hypothesis (Firth, 1957)

- ‘You can tell a word by the company it keeps’
  - *The cat sat on the mat*
  - *The dog sat on the mat*
  - *The elephant sat on the mat*
  - *The quickly sat on the mat*

# Embeddings: Word2Vec

- CBOW model predict missing word (focus word) using context (surrounding words).
- Skip gram model predicts context based on the word in focus.
- Context is a fixed number of words to the left and right of the word in focus.
- Maximize average log probability of context words co-occurring with focus words.

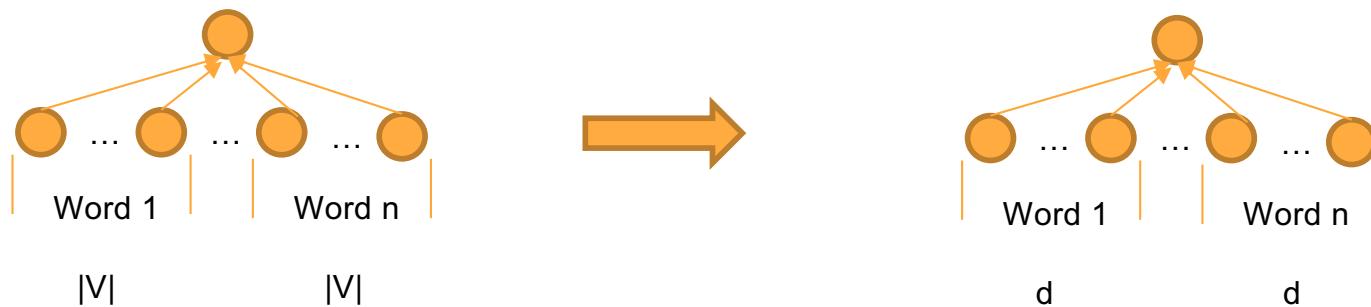

# Properties of embeddings

- They are dense: 0.53, 0.2, -1.2, ....
- They are low dimensional: (typically  $50 \leq d \leq 300$ )
- Embed domain semantics:
  - ‘king’ - ‘man’ + ‘woman’  $\approx$  ‘queen’
  - ‘paris’ - ‘france’ + ‘spain’  $\approx$  ‘madrid’
- Generalize easily!

## Properties of embeddings (cont.)

- They are used as input across a variety NLP tasks (transfer learning!):

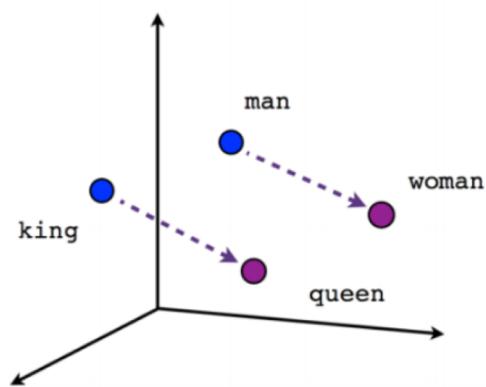

Total #  
of input  
parameters:

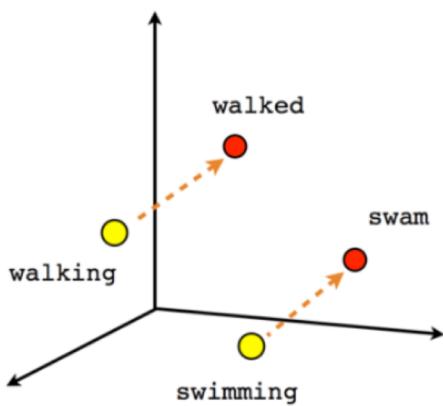

$$n * |V|$$

>>

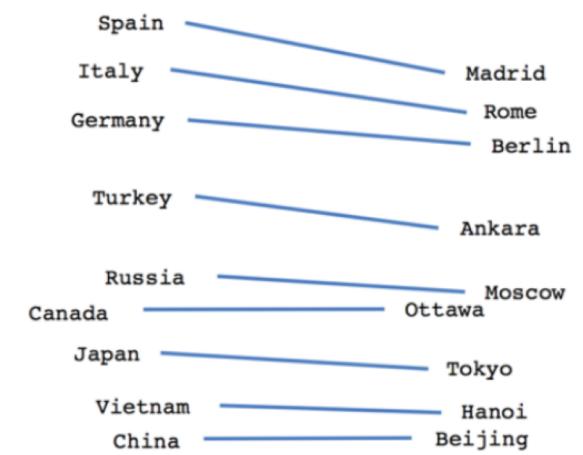

$$n * d$$

Male-Female

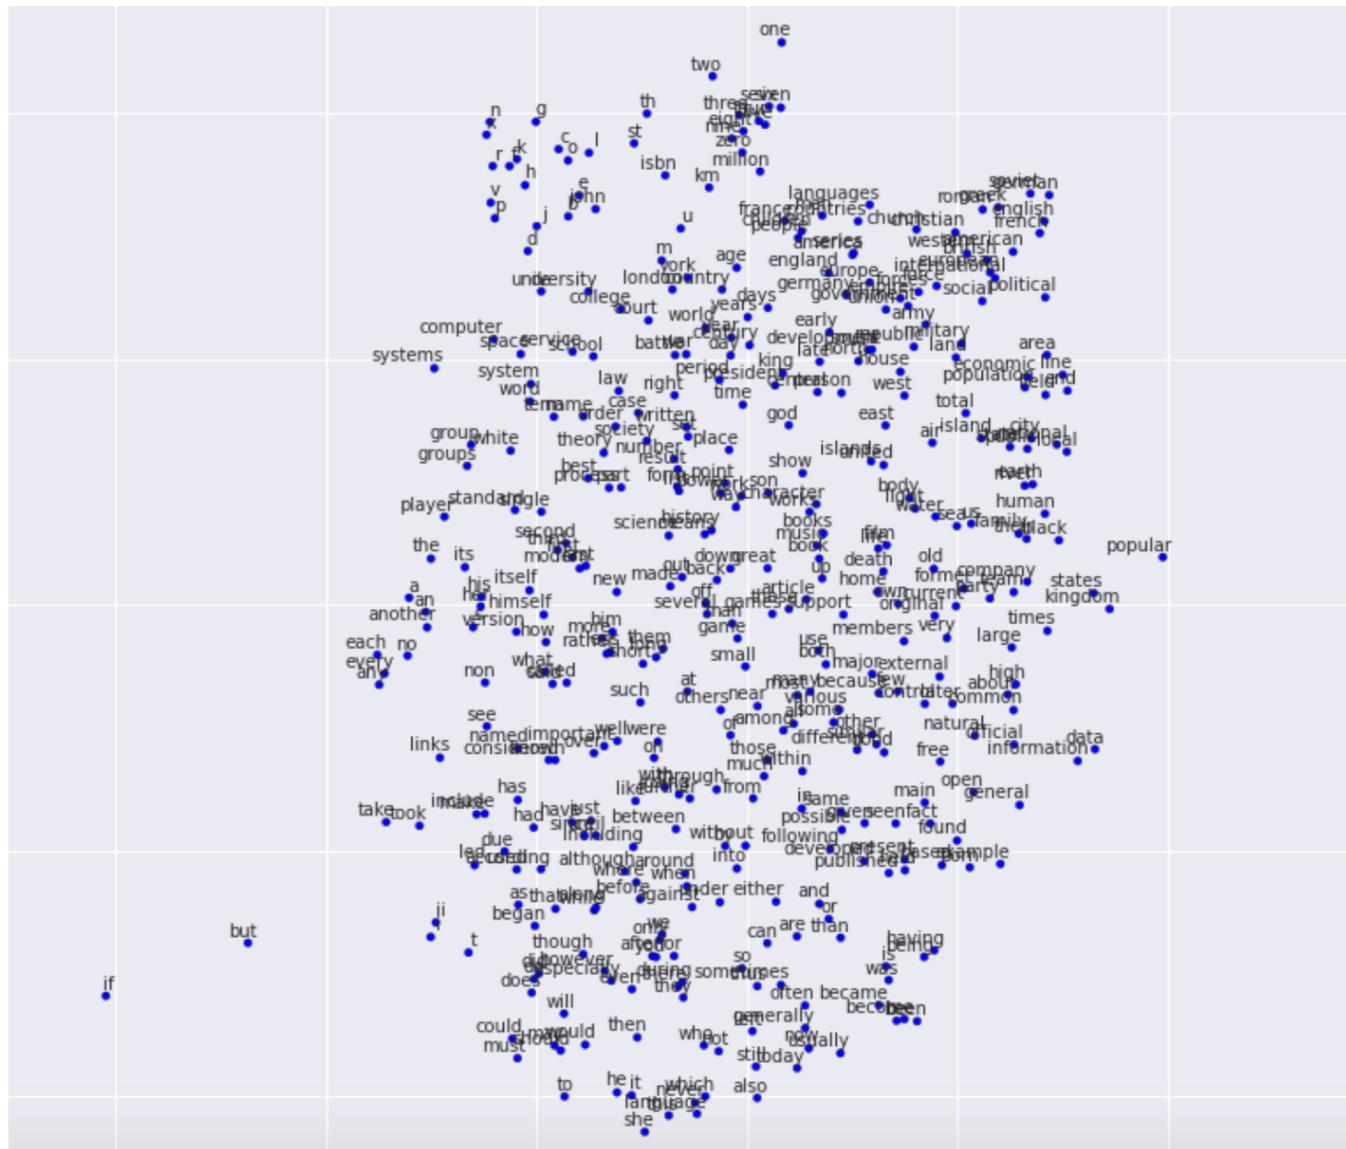

Verb tense

Country-Capital

<https://www.tensorflow.org/tutorials/representation/word2vec>

# USING WORD EMBEDDINGS

1. Learn an Embedding
  - Use KERAS embedding layer
  
2. Reuse an Embedding
  - Download pre-trained word vectors

# TENSORFLOW, KERAS, PANDAS

# WHAT IS TENSORFLOW?

Created by Google, tensorflow.org

- “Open source software library for machine intelligence”
  - Available on GitHub
- Flexibility—express your computation as a data flow graph
  - If you can express it in TF syntax you can run it
- Portability—CPUs and GPUs, workstation, server, mobile
- Language options—Python, C++, R
- Performance—Tuned for performance on CPUs and GPUs

# KERAS

- Developed by Francois Chollet, Google Research Engineer
- Modular neural network written in Python
- Runs on TensorFlow, CNTK, and Theano (no longer supported)
- Keras library allows for easy and fast prototyping
- Runs on GPUs and CPUs
- Now packaged with latest TensorFlow

```
#### Keras
from keras.models import Sequential
from keras.layers import Dense

model = Sequential()

# Stacking layers by using .add():
model.add(Dense(units=64, activation='relu', input_dim=100))
model.add(Dense(units=10, activation='softmax'))
model.compile(loss='categorical_crossentropy', optimizer='sgd', metrics=['accuracy'])
model.fit(x_train, y_train, epochs=5, batch_size=32)
```

More here:

<https://keras.io/>

# PANDAS

- Open-source, BSD-licensed project
- Fast and efficient DataFrame object for data manipulation with integrated indexing
  - DataFrames used in this lab
  - Ideal for neural networks
- Contains tools for reading and writing data between in-memory data structures and different formats such as:
  - CSV and text files - used in this lab
  - Microsoft Excel
  - SQL databases
  - HDF5

# NETWORK ARCHITECTURE - MLP

# MULTI-LAYER PERCEPTRON

- MLP = Multi-layer Perceptron
  - Traditional *fully connected feed-forward network*
  - Also called *dense network*
  - Fixed size input

# **LAB DISCUSSION / OVERVIEW**

# LAB OVERVIEW

- Perform text classification for sentiment analysis
  - Classify each document into one of two different sentiments:
    - "positive" or "negative"
- Components of lab include:
  - Pandas
  - TensorFlow and Keras
  - MLP, CNN, RNN/LSTM

# LAB PROCESS

## Data Preparation:

1. Load libraries, data and visualize / evaluate data
2. Divide dataset between Training, Validation and Test sets
3. Implement TF-IDF using Keras
4. Create matrix for labels

# LAB PROCESS

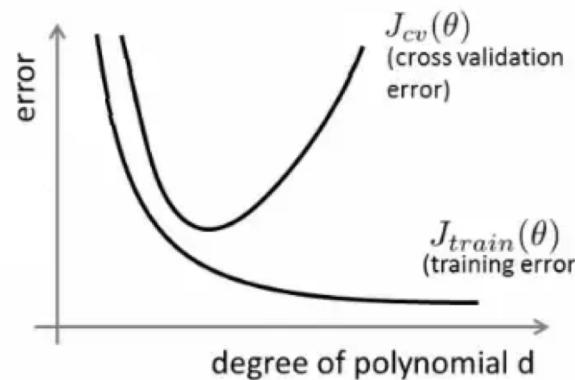

Build and evaluate 3 network architectures:

1. Design simple neural network
  2. Visualize network architecture
  3. Train model
  4. Compare test, validation and training accuracy
  5. Attempt to improve the model
- 
- **Complete the Simple Multi-Layer Perceptron Model portion of the lab.**
  - **Stop when you reach One-Dimensional Convolutional Neural Network Model, we'll regroup.**

# **TRAINING TERMINOLOGY**

# Overfitting and Underfitting

- Overfitting refers to a model that fits the training data too well.
- Your model begins to “memorize” the training data and becomes less likely to generalize to unseen test data.
- Validation error  $>>$  training error
- Correct by either simplifying model, generalizing model, or getting additional data.
- Underfitting refers to large training error. Increase complexity of model.

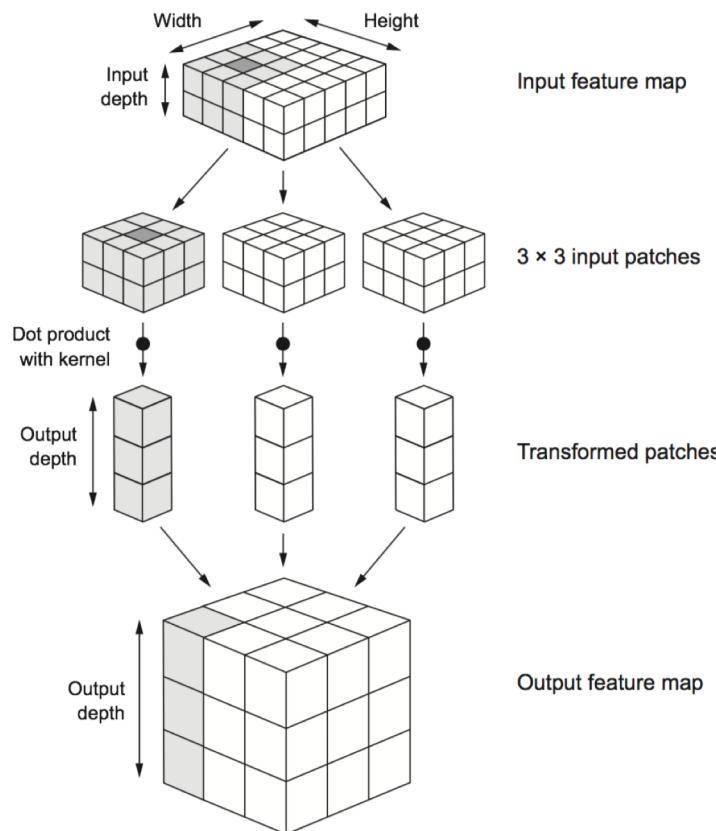

# Learning terminology

- Learning rate -- weighting of  $dE/dW$
- Decay rate - rate to reduce learning rate
- Decay steps: number of steps to execute before changing learning rate
- Number of epochs - number of times to cycle through the input data
- Batch size: number of samples that going to be propagated through the network

# NETWORK ARCHITECTURE - CNNs

# Convolution Neural Network (CNN)

- A CNN is made up of Layers: convolution, pooling, fully connected.
- Each layer transforms an input 3D volume to an output 3D volume.
- Learns local parameters in input space using a stack of (e.g., 3x3) convolution filters
- The patterns the filters learn are translation invariant.
- Learn spatial hierarchies of patterns by adding conv. and pooling layers. E.g., edges, shapes, motifs.

# LAB PROCESS

Build and evaluate the One-Dimensional Convolutional Neural network architectures

1. Design simple neural network
  2. Visual network architecture
  3. Train model
  4. Compare test, validation and training accuracy
  5. Attempt to improve the model
- 
- If you finish early, complete the RNN model.

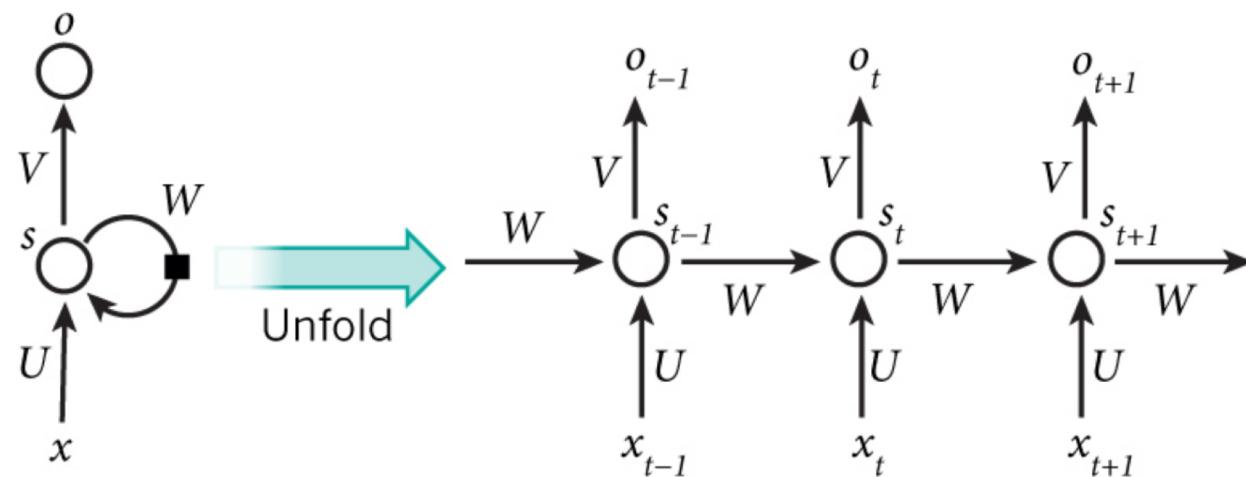

# NETWORK ARCHITECTURE - RNNS / LSTMS

# RECURRENT NEURAL NETWORK

- RNN = Recurrent Neural Network
  - Similar to traditional feed-forward network
  - RNNs include previous output state
  - Limited to looking back only a few steps due to vanishing gradient
    - Errors are backpropagated through time
    - Inputs from previous time steps get exponentially down weighted and are eventually driven to zero

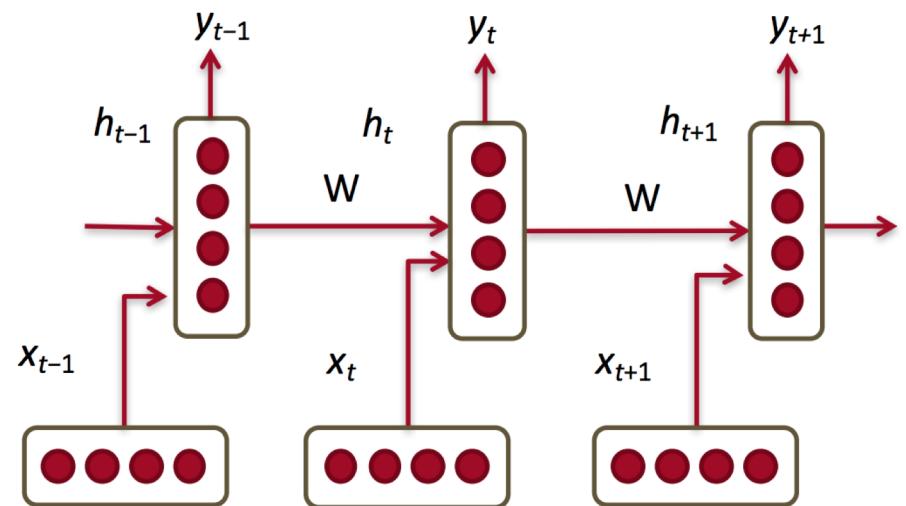

# Recurrent Neural Network (RNN)

- RNNs have connections between units along a sequence.
- RNN's use the hidden state from the last time step and the input at the current step to make predictions.
- Allow RNN's can capture dynamic temporal behavior for a time sequence.

# RECURRENT LAYERS

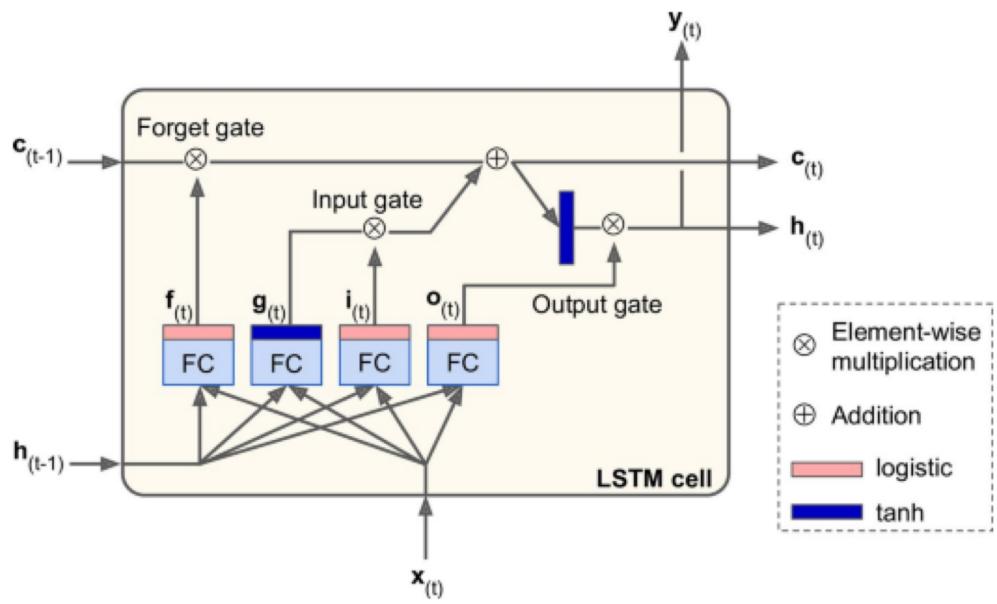

- RNNs share the weights between the time steps
- Condition the neural network on all previous words
  - (and all document in the end)
- RAM requirement only scales with number of timesteps

# LONG SHORT TERM MEMORY

- LSTM = Long Short Term Memory
  - Variant of RNN
  - No (less) of a vanishing gradient problem
  - LSTMs can learn “very deep” tasks that require memories of words N words ago

# Long Short Term (LSTM) Cell

$$\begin{aligned}
 \mathbf{i}_{(t)} &= \sigma(\mathbf{W}_{xi}^T \cdot \mathbf{x}_{(t)} + \mathbf{W}_{hi}^T \cdot \mathbf{h}_{(t-1)} + \mathbf{b}_i) \\
 \mathbf{f}_{(t)} &= \sigma(\mathbf{W}_{xf}^T \cdot \mathbf{x}_{(t)} + \mathbf{W}_{hf}^T \cdot \mathbf{h}_{(t-1)} + \mathbf{b}_f) \\
 \mathbf{o}_{(t)} &= \sigma(\mathbf{W}_{xo}^T \cdot \mathbf{x}_{(t)} + \mathbf{W}_{ho}^T \cdot \mathbf{h}_{(t-1)} + \mathbf{b}_o) \\
 \mathbf{g}_{(t)} &= \tanh(\mathbf{W}_{xg}^T \cdot \mathbf{x}_{(t)} + \mathbf{W}_{hg}^T \cdot \mathbf{h}_{(t-1)} + \mathbf{b}_g) \\
 \mathbf{c}_{(t)} &= \mathbf{f}_{(t)} \otimes \mathbf{c}_{(t-1)} + \mathbf{i}_{(t)} \otimes \mathbf{g}_{(t)} \\
 \mathbf{y}_{(t)} &= \mathbf{h}_{(t)} \otimes \tanh(\mathbf{c}_{(t)})
 \end{aligned}$$

⊗ Element-wise multiplication  
⊕ Addition
  
■ logistic    ■ tanh

# **LAB DISCUSSION / OVERVIEW**

# LAB PROCESS

Build and evaluate the LSTM network architecture

1. Design simple neural network
2. Visual network architecture
3. Train model
4. Compare test, validation and training accuracy
5. Attempt to improve the model

This can be a take-home exercise.
